Logic, constructively

Conjunction and disjunction

Forget truth tables! Instead, define the logical operators "and" \land and "or" \lor by:

Conjunction \wedge is the logical operator defined by the rules:

- $^{\wedge}$ intro: If p is true and q is true, then $p \wedge q$ is true.
- \wedge elim₁: If $p \wedge q$ is true, then p is true.
- $^{\wedge}$ elim₂: If $p \wedge q$ is true, then q is true.

Disjunction \vee is the logical operator defined by the rules:

- $^{\vee}$ intro₁: If p is true, then $p \vee q$ is true.
- $^{\vee}$ intro₂: If q is true, then $p \vee q$ is true.
- $^{\vee}$ elim: If $p \lor q$ is true, and if r can be derived from p and from q, then r is true.

Introduction rules explain how to prove a proposition involving a particular connective, while elimination rules explain how to use a hypothesis involving a particular connective.

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof:

p, q, r

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof: By \Rightarrow intro, assume that $(p \Rightarrow q) \land (q \Rightarrow r)$ is true; our goal is to prove $p \Rightarrow r$.

givens: p, q, r $(p \Rightarrow q) \land (q \Rightarrow r)$

goal:

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof: By $\stackrel{\Rightarrow}{=}$ intro, assume that $(p\Rightarrow q)\wedge (q\Rightarrow r)$ is true; our goal is to prove $p\Rightarrow r$. By $\stackrel{\wedge}{=}$ elim $_1$ and $\stackrel{\wedge}{=}$ elim $_2$ it follows that $p\Rightarrow q$ and $q\Rightarrow r$ are true.

givens:
$$p, q, r$$
 $(p \Rightarrow q) \land (q \Rightarrow r)$
 $p \Rightarrow q$
 $q \Rightarrow r$

goal: p =

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof: By \Rightarrow intro, assume that $(p \Rightarrow q) \land (q \Rightarrow r)$ is true; our goal is to prove $p \Rightarrow r$. By $^{\wedge}$ elim $_1$ and $^{\wedge}$ elim $_2$ it follows that $p \Rightarrow q$ and $q \Rightarrow r$ are true. By $^{\Rightarrow}$ intro again, also assume p is true; now our goal is just to prove r.

givens:
$$p, q, r$$
 $(p \Rightarrow q) \land (q \Rightarrow r)$
 $p \Rightarrow q$
 $q \Rightarrow r$
 p

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof: By \Rightarrow intro, assume that $(p\Rightarrow q)\land (q\Rightarrow r)$ is true; our goal is to prove $p\Rightarrow r$. By $^{\wedge}\text{elim}_1$ and $^{\wedge}\text{elim}_2$ it follows that $p\Rightarrow q$ and $q\Rightarrow r$ are true. By $^{\Rightarrow}$ intro again, also assume p is true; now our goal is just to prove r. By $^{\Rightarrow}\text{elim}$, from p and $p\Rightarrow q$, we may conclude that q is true.

givens:
$$p, q, r$$
 $(p \Rightarrow q) \land (q \Rightarrow r)$
 $p \Rightarrow q$
 $q \Rightarrow r$
 $p \Rightarrow q$

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Proof: By $\stackrel{\Rightarrow}{\Rightarrow}$ intro, assume that $(p\Rightarrow q)\land (q\Rightarrow r)$ is true; our goal is to prove $p\Rightarrow r$. By $\stackrel{\wedge}{\circ}$ elim $_1$ and $\stackrel{\wedge}{\circ}$ elim $_2$ it follows that $p\Rightarrow q$ and $q\Rightarrow r$ are true. By $\stackrel{\Rightarrow}{\Rightarrow}$ intro again, also assume p is true; now our goal is just to prove r. By $\stackrel{\Rightarrow}{\Rightarrow}$ elim, from p and $p\Rightarrow q$, we may conclude that q is true. By $\stackrel{\Rightarrow}{\Rightarrow}$ elim again, from q and $q\Rightarrow r$, we may conclude r is true as desired.

givens: p, q, r $(p \Rightarrow q) \land (q \Rightarrow r)$ $p \Rightarrow q$ $q \Rightarrow r$ p q q r

Type theory is a formal system for mathematical statements and proofs that has the following primitive notions:

ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group

Type theory is a formal system for mathematical statements and proofs that has the following primitive notions:

- ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $\emph{K}_4:$ Group

Type theory is a formal system for mathematical statements and proofs that has the following primitive notions:

- types, e.g., \mathbb{N} , \mathbb{Q} , Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $\mathcal{K}_4:\mathsf{Group}$

Given any types A and B, one may form the

product type
$$A \times B$$
 , function type $A \rightarrow B$, coproduct type $A + B$

whose terms are governed by introduction and elimination (and computation) rules.

Type theory is a formal system for mathematical statements and proofs that has the following primitive notions:

- ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $K_4:\mathsf{Group}$

Given any types A and B, one may form the

```
product type A \times B , function type A \rightarrow B , coproduct type A + B
```

whose terms are governed by introduction and elimination (and computation) rules.

Mathematics in type theory:

- To state a conjecture, one forms a type that encodes its statement.
- To prove the theorem, one constructs a term in that type.

Conjunction and Products

- $^{\wedge}$ intro: If p is true and q is true, then $p \wedge q$ is true.
- \wedge elim₁: If $p \wedge q$ is true, then p is true.
- $^{\wedge}$ elim₂: If $p \wedge q$ is true, then q is true.

Given types A and B, the product type $A \times B$ is governed by the rules:

- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$
- \times elim₁: given a term $p:A\times B$ there is a term $\pi_1p:A$
- \times elim₂: given a term $p:A\times B$ there is a term $\pi_2p:B$

plus computation rules that relate pairings and projections.

Implication and functions

Implication \Rightarrow is the logical operator defined by the rules:

- \Rightarrow intro: If q can be derived from the assumption that p is true, then $p \Rightarrow q$ is true.
- \Rightarrow elim: If $p \Rightarrow q$ is true and p is true, then q is true.

Given types A and B, the function type $A \rightarrow B$ is governed by the rules:

• \rightarrow intro: if given any term \times : A there is a term b_{\times} : B,

then there is a term $\lambda x.b_x : A \to B$

• \rightarrow elim: given terms $f: A \rightarrow B$ and a: A, there is a term f(a): B

plus computation rules that relate λ -abstractions and evaluations.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction:

P, Q, R

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By \rightarrow intro, suppose given $h: (P \rightarrow Q) \times (Q \rightarrow R)$; our goal is a term of type $P \rightarrow R$.

givens:
$$P, Q, R$$

 $h: (P \rightarrow Q) \times (Q \rightarrow R)$

goal:

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By $\stackrel{\rightarrow}{\rightarrow}$ intro, suppose given $h: (P \rightarrow Q) \times (Q \rightarrow R)$; our goal is a term of type $P \rightarrow R$. By $\stackrel{\times}{\rightarrow}$ elim $_1$ and $\stackrel{\times}{\rightarrow}$ elim $_2$, we have $\pi_1 h: P \rightarrow Q$ and $\pi_2 h: Q \rightarrow R$.

givens:
$$P, Q, R$$
 $h: (P \rightarrow Q) \times (Q \rightarrow R)$
 $\pi_1 h: P \rightarrow Q$
 $\pi_2 h: Q \rightarrow R$

goal: $P \rightarrow R$

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By \rightarrow intro, suppose given $h: (P \rightarrow Q) \times (Q \rightarrow R)$; our goal is a term of type $P \rightarrow R$. By $^{\times}$ elim $_1$ and $^{\times}$ elim $_2$, we have $\pi_1 h: P \rightarrow Q$ and $\pi_2 h: Q \rightarrow R$. By $^{\rightarrow}$ intro again, suppose given p: P; now our goal is a term of type R.

givens:
$$P, Q, R$$

$$h: (P \rightarrow Q) \times (Q \rightarrow R)$$

$$\pi_1 h: P \rightarrow Q$$

$$\pi_2 h: Q \rightarrow R$$

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By $\stackrel{\rightarrow}{\rightarrow}$ intro, suppose given $h: (P \rightarrow Q) \times (Q \rightarrow R)$; our goal is a term of type $P \rightarrow R$. By $\stackrel{\times}{\rightarrow}$ elim $_1$ and $\stackrel{\times}{\rightarrow}$ elim $_2$, we have $\pi_1 h: P \rightarrow Q$ and $\pi_2 h: Q \rightarrow R$. By $\stackrel{\rightarrow}{\rightarrow}$ intro again, suppose given p: P; now our goal is a term of type R. By $\stackrel{\rightarrow}{\rightarrow}$ elim, from p: P and $\pi_1 h: P \rightarrow Q$, we obtain $\pi_1 h(p): Q$.

givens:
$$P, Q, R$$

$$h: (P \rightarrow Q) \times (Q \rightarrow R)$$

$$\pi_1 h: P \rightarrow Q$$

$$\pi_2 h: Q \rightarrow R$$

$$p: P$$

$$\pi_1 h(p): Q$$

goal: R

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By \rightarrow intro, suppose given $h: (P \rightarrow Q) \times (Q \rightarrow R)$; our goal is a term of type $P \rightarrow R$. By $^{\times}$ elim $_1$ and $^{\times}$ elim $_2$, we have $\pi_1 h: P \rightarrow Q$ and $\pi_2 h: Q \rightarrow R$. By $^{\rightarrow}$ intro again, suppose given p: P; now our goal is a term of type R. By $^{\rightarrow}$ elim, from p: P and $\pi_1 h: P \rightarrow Q$, we obtain $\pi_1 h(p): Q$. By $^{\rightarrow}$ elim again, from $\pi_1 h(p): Q$ and $\pi_2 h: Q \rightarrow R$, we obtain $\pi_2 h(\pi_1 h(p)): R$ as desired.

```
givens: P, Q, R
h: (P \rightarrow Q) \times (Q \rightarrow R)
\pi_1 h: P \rightarrow Q
\pi_2 h: Q \rightarrow R
p: P
\pi_1 h(p): Q
\pi_2 h(\pi_1 h(p)): R
goal: R
```

Theorem. For any propositions p, q, and r, $((p \Rightarrow q) \land (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$.

Theorem. For any types P, Q, and R, $((P \rightarrow Q) \times (Q \rightarrow R)) \rightarrow (P \rightarrow R)$.

Construction: By →intro, suppose given P, Q, R $h: (P \to Q) \times (Q \to R)$; our goal is a term of givens: $h: (P \to Q) \times (Q \to R)$ type $P \to R$. By \times elim₁ and \times elim₂, we have $\pi_1 h: P \to Q$ $\pi_1 h: P \to Q$ and $\pi_2 h: Q \to R$. By $\to intro$ $\pi_2 h: Q \to R$ again, suppose given p:P; now our goal is a p:Pterm of type R. By \rightarrow elim, from p:P and $\pi_1 h(p) : Q$ $\pi_1 h: P \to Q$, we obtain $\pi_1 h(p): Q$. By $\stackrel{\rightarrow}{\rightarrow} elim$ $\pi_2 h(\pi_1 h(p)) : R$ again, from $\pi_1 h(p) : Q$ and $\pi_2 h : Q \to R$, we obtain $\pi_2 h(\pi_1 h(p)) : R$ as desired. goal:

This constructs a term $\lambda h.\lambda p.\pi_2 h(\pi_1 h(p)): ((P \to Q) \times (Q \to R)) \to (P \to R).$

Disjunction and coproducts

Disjunction \vee is the logical operator defined by the rules:

- $^{\vee}$ intro₁: If p is true, then $p \vee q$ is true.
- $^{\vee}$ intro₂: If q is true, then $p \vee q$ is true.
- \vee elim: If $p \vee q$ is true, and if r can be derived from p and from q, then r is true.

Given types A and B, the coproduct type A + B is governed by the rules:

- +intro₁: given a term a:A, there is a term $\iota_1 a:A+B$
- +intro₂: given a term b : B, there is a term $\iota_2 b : A + B$
- +elim: given a types C and terms c_a , d_b : C for each a: A and b: B respectively, there is a term +ind(c,d)(x): C for each x: A+B

plus computation rules that relate the inclusions and the elimination.

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$.

• \rightarrow intro: if given any term x:A there is a term $b_x:B$, there is a term $\lambda x.b_x:A\to B$

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \to intro, suppose given $h: (A+B) \to C$; our goal is a term of type $(A \to C) \times (B \to C)$. By \times intro, it suffices to define terms of type $A \to C$ and type $B \to C$.

- \rightarrow intro: if given any term x:A there is a term $b_x:B$, there is a term $\lambda x.b_x:A\to B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$. By \times intro, it suffices to define terms of type $A \rightarrow C$ and type $B \rightarrow C$. By \rightarrow intro, to define a term of type $A \rightarrow C$ it suffices to assume a term a: A and define a term of type C.

- \rightarrow intro: if given any term \times : A there is a term b_{\times} : B, there is a term $\lambda \times b_{\times}$: $A \rightarrow B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$. By \times intro, it suffices to define terms of type $A \rightarrow C$ and type $B \rightarrow C$. By \rightarrow intro, to define a term of type $A \rightarrow C$ it suffices to assume a term a: A and define a term of type C. By + intro, we then have a term $\iota_1 a: A + B$.

- \rightarrow intro: if given any term \times : A there is a term b_{\times} : B, there is a term $\lambda \times b_{\times}$: $A \rightarrow B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$
- $^+$ intro₁: given a term a : A, there is a term $\iota_1 a$: A + B

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$. By \times intro, it suffices to define terms of type $A \rightarrow C$ and type $B \rightarrow C$. By \rightarrow intro, to define a term of type $A \rightarrow C$ it suffices to assume a term a: A and define a term of type C. By +intro₁, we then have a term $\iota_1 a: A+B$. Then by \rightarrow elim we obtain a term $h(\iota_1 a): C$.

- \rightarrow intro: if given any term \times : A there is a term b_{\times} : B, there is a term $\lambda \times b_{\times}$: $A \rightarrow B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$
- +intro₁: given a term a:A, there is a term $\iota_1 a:A+B$
- \rightarrow elim: given terms $f: A \rightarrow B$ and a: A, there is a term f(a): B

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$. By \times intro, it suffices to define terms of type $A \rightarrow C$ and type $B \rightarrow C$. By \rightarrow intro, to define a term of type $A \rightarrow C$ it suffices to assume a term a: A and define a term of type C. By +intro₁, we then have a term $\iota_1 a: A+B$. Then by \rightarrow elim we obtain a term $h(\iota_1 a): C$. Similarly, by \rightarrow intro, +intro₂, and \rightarrow elim we have $\lambda b.h(\iota_2 b): B \rightarrow C$.

- \rightarrow intro: if given any term \times : A there is a term b_{\times} : B, there is a term $\lambda \times b_{\times}$: $A \rightarrow B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$
- +intro₁: given a term a:A, there is a term $\iota_1 a:A+B$
- \rightarrow elim: given terms $f: A \rightarrow B$ and a: A, there is a term f(a): B

Theorem. For any types A, B, and C, $((A+B) \rightarrow C) \rightarrow ((A \rightarrow C) \times (B \rightarrow C))$.

Construction: By \rightarrow intro, suppose given $h: (A+B) \rightarrow C$; our goal is a term of type $(A \rightarrow C) \times (B \rightarrow C)$. By \times intro, it suffices to define terms of type $A \rightarrow C$ and type $B \rightarrow C$. By \rightarrow intro, to define a term of type $A \rightarrow C$ it suffices to assume a term a: A and define a term of type C. By +intro₁, we then have a term $\iota_1 a: A+B$. Then by \rightarrow elim we obtain a term $h(\iota_1 a): C$. Similarly, by \rightarrow intro, +intro₂, and \rightarrow elim we have $\lambda b.h(\iota_2 b): B \rightarrow C$.

- \rightarrow intro: if given any term x:A there is a term $b_x:B$, there is a term $\lambda x.b_x:A\to B$
- \times intro: given terms a:A and b:B there is a term $(a,b):A\times B$
- +intro₁: given a term a:A, there is a term $\iota_1 a:A+B$
- \rightarrow elim: given terms $f: A \rightarrow B$ and a: A, there is a term f(a): B

This constructs $\lambda h.(\lambda a.h(\iota_1 a), \lambda b.h(\iota_2 b)) : ((A + B) \to C) \to ((A \to C) \times (B \to C)).$

 $\forall:\Pi::\exists:\Sigma$

Universal and existential quantification

Let $p: X \to \{\bot, \top\}$ be an X-indexed family of propositions, a predicate p(x) on $x \in X$. For example:

- " $2^{2^n}-1$ is prime" is a predicate on $n\in\mathbb{N}$
- ullet " $z^2=-1$ " is a predicate on $z\in\mathbb{C}$

Universal and existential quantification

Let $p: X \to \{\bot, \top\}$ be an X-indexed family of propositions, a predicate p(x) on $x \in X$. For example:

- " $2^{2^n}-1$ is prime" is a predicate on $n \in \mathbb{N}$
- " $z^2 = -1$ " is a predicate on $z \in \mathbb{C}$

Universal quantification $\forall x \in X, p(x)$ is the logical formula defined by the rules:

- \forall intro: If p(x) can be derived from the assumption that x is an arbitrary element of X, then $\forall x \in X, p(x)$ is true.
- \forall elim: If $\forall x \in X, p(x)$ is true and $a \in X$, then p(a) is true.

Existential quantification $\exists x \in X, p(x)$ is the logical formula defined by the rules:

- \exists intro: If $a \in X$ and p(a) is true, then $\exists x \in X, p(x)$ is true.
- \exists elim: If $\exists x \in X, p(x)$ is true and q can be derived from the assumption that p(a) is true for some $a \in X$, then q is true.

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

 \exists -intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$. \exists elim: If $\exists x \in X, p(x)$ and a follows from

 $\exists \text{elim: If } \exists x \in X, p(x) \text{ and } q \text{ follows from } p(a) \text{ for some } a \in X, \text{ then } q.$

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x, y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x', y').$$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$.

 \forall elim: If $\forall x \in X$, p(x) and $a \in X$, then p(a).

∃-intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$.
∃elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, \rho(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, \rho(x',y').$$

Proof:

givens:

р

goal:
$$\exists y \in Y, \forall x \in X, p(x, y)$$

 $\Rightarrow \forall x' \in X, \exists y' \in Y, p(x', y')$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

∃-intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$.
∃elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x',y').$$

Proof: By \Rightarrow intro, we may assume $\exists y \in Y, \forall x \in X, p(x, y)$; our goal is to prove $\forall x' \in X, \exists y' \in Y, p(x', y')$.

givens:

$$\exists y \in Y, \forall x \in X, p(x, y)$$

goal: $\forall x' \in X, \exists y' \in Y, p(x', y')$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

∃-intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$.
∃elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x',y').$$

Proof: By \Rightarrow intro, we may assume $\exists y \in Y, \forall x \in X, p(x,y)$; our goal is to prove $\forall x' \in X, \exists y' \in Y, p(x',y')$. By \exists elim, we may assume $y_0 \in Y$ makes $\forall x \in X, p(x,y_0)$ true.

givens:

$$\exists y \in Y, \forall x \in X, p(x, y)$$

$$\forall x \in X, p(x, y_0)$$

goal:
$$\forall x' \in X, \exists y' \in Y, p(x', y')$$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

 \exists -intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$. \exists elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x',y').$$

Proof: By \Rightarrow intro, we may assume $\exists y \in Y, \forall x \in X, p(x,y)$; our goal is to prove $\forall x' \in X, \exists y' \in Y, p(x',y')$. By \exists elim, we may assume $y_0 \in Y$ makes $\forall x \in X, p(x,y_0)$ true. By \forall intro, we may fix $x' \in X$; our goal is to prove that $\exists y' \in Y, p(x',y')$.

givens:
$$p$$

$$\exists y \in Y, \forall x \in X, p(x, y)$$

$$\forall x \in X, p(x, y_0)$$

$$x'$$

goal: $\exists y' \in Y, p(x', y')$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

 \exists -intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$. \exists elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

goal:

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x',y').$$

Proof: By \Rightarrow intro, we may assume $\exists y \in Y, \forall x \in X, p(x,y)$; our goal is to prove $\forall x' \in X, \exists y' \in Y, p(x',y')$. By \exists elim, we may assume $y_0 \in Y$ makes $\forall x \in X, p(x,y_0)$ true. By \forall intro, we may fix $x' \in X$; our goal is to prove that $\exists y' \in Y, p(x',y')$. But by \forall elim, we know that $p(x',y_0)$ is true.

givens:
$$p$$

$$\exists y \in Y, \forall x \in X, p(x,y)$$

$$\forall x \in X, p(x,y_0)$$

$$x'$$

$$p(x',y_0)$$

 $\exists v' \in Y, p(x', v')$

 \forall -intro: If p(x) for any $x \in X$, then $\forall x \in X, p(x)$. \forall elim: If $\forall x \in X, p(x)$ and $a \in X$, then p(a).

 \exists -intro: If $a \in X$ and p(a), then $\exists x \in X, p(x)$. \exists elim: If $\exists x \in X, p(x)$ and q follows from p(a) for some $a \in X$, then q.

Theorem. For any predicate p(x, y) on $x \in X$ and $y \in Y$,

$$\exists y \in Y, \forall x \in X, p(x,y) \Rightarrow \forall x' \in X, \exists y' \in Y, p(x',y').$$

Proof: By \Rightarrow intro, we may assume $\exists y \in Y, \forall x \in X, p(x,y)$; our goal is to prove $\forall x' \in X, \exists y' \in Y, p(x',y')$. By \exists elim, we may assume $y_0 \in Y$ makes $\forall x \in X, p(x,y_0)$ true. By \forall intro, we may fix $x' \in X$; our goal is to prove that $\exists y' \in Y, p(x',y')$. But by \forall elim, we know that $p(x',y_0)$ is true. So by \exists intro, it follows that $\exists y' \in Y, p(x',y')$ is true.

Dependent type theory is a formal system for mathematical statements and proofs that has the following primitive notions. In addition to the:

ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group

Dependent type theory is a formal system for mathematical statements and proofs that has the following primitive notions. In addition to the:

- ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $\emph{K}_{4}:$ Group

Dependent type theory is a formal system for mathematical statements and proofs that has the following primitive notions. In addition to the:

- types, e.g., \mathbb{N} , \mathbb{Q} , Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $K_4:$ Group

there are also:

• dependent types, e.g., is-prime: $\mathbb{N} \to \mathsf{Type}$, $\mathbb{R}^{\bullet} : \mathbb{N} \to \mathsf{Type}$, $\mathsf{Mat}_{\bullet \times \bullet} : \mathbb{N} \to \mathbb{N} \to \mathsf{Type}$

Dependent type theory is a formal system for mathematical statements and proofs that has the following primitive notions. In addition to the:

- types, e.g., \mathbb{N} , \mathbb{Q} , Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $K_4:\mathsf{Group}$

there are also:

- dependent types, e.g., is-prime: $\mathbb{N} \to \mathsf{Type}$, $\mathbb{R}^{\bullet}: \mathbb{N} \to \mathsf{Type}$, $\mathsf{Mat}_{\bullet \times \bullet}: \mathbb{N} \to \mathbb{N} \to \mathsf{Type}$
- dependent terms, e.g., $\vec{0}^{\bullet}:\prod_{n:\mathbb{N}}\mathbb{R}^{n}$, $\emph{I}_{\bullet}:\prod_{n:\mathbb{N}}\mathsf{Mat}_{n,n}$, $\emph{S}_{\bullet}:\prod_{n:\mathbb{N}}\mathsf{Group}$

Dependent type theory is a formal system for mathematical statements and proofs that has the following primitive notions. In addition to the:

- ullet types, e.g., $\mathbb N$, $\mathbb Q$, Group
- ullet terms, e.g., $17:\mathbb{N}$, $\sqrt{2}:\mathbb{R}$, $\mathcal{K}_4:\mathsf{Group}$

there are also:

- dependent types, e.g., is-prime: $\mathbb{N} \to \mathsf{Type}$, $\mathbb{R}^{\bullet}: \mathbb{N} \to \mathsf{Type}$, $\mathsf{Mat}_{\bullet \times \bullet}: \mathbb{N} \to \mathbb{N} \to \mathsf{Type}$
- dependent terms, e.g., $\vec{0}^{\bullet}:\prod_{n:\mathbb{N}}\mathbb{R}^{n}$, $\emph{I}_{\bullet}:\prod_{n:\mathbb{N}}\mathsf{Mat}_{n,n}$, $\emph{S}_{\bullet}:\prod_{n:\mathbb{N}}\mathsf{Group}$

all of which can occur in an arbitrary context of variables from previously-defined types.

In a mathematical statement of the form "Let ...be ...then ..." The stuff following the "let" likely declares the names of the variables in the context described after the "be", while the stuff after the "then" most likely describes a type or term in that context.

Universal quantification and dependent functions

For any predicate $p: X \to \{\bot, \top\}$, the universal quantification $\forall x \in X, p(x)$ is the logical formula defined by the rules:

- \forall intro: If p(x) can be derived from the assumption that x is an arbitrary element of X, then $\forall x \in X, p(x)$ is true.
- \forall elim: If $\forall x \in X, p(x)$ is true and $a \in X$, then p(a) is true.

For any family of types $B: A \to \mathsf{Type}$, the dependent function type $\prod_{x:A} B(x)$ is governed by the rules:

- Intro: if in the context of a variable x : A there is a term $b_x : B(x)$
 - there is a term $\lambda x.b_x:\prod_{x:A}B(x)$
- Π elim: given terms $f: \prod_{x:A} B(x)$ and a:A there is a term f(a): B(a) plus computation rules that relate λ -abstractions and evaluations.

Universal quantification and dependent functions

For any predicate $p: X \to \{\bot, \top\}$, the universal quantification $\forall x \in X, p(x)$ is the logical formula defined by the rules:

- \forall intro: If p(x) can be derived from the assumption that x is an arbitrary element of X, then $\forall x \in X, p(x)$ is true.
- \forall elim: If $\forall x \in X, p(x)$ is true and $a \in X$, then p(a) is true.

For any family of types $B: A \to \mathsf{Type}$, the dependent function type $\prod_{x:A} B(x)$ is governed by the rules:

- II intro: if in the context of a variable x : A there is a term $b_x : B(x)$
 - there is a term $\lambda x.b_x:\prod_{x:A}B(x)$
- In elim: given terms $f: \prod_{x:A} B(x)$ and a:A there is a term f(a): B(a) plus computation rules that relate λ -abstractions and evaluations.

For a constant type family $B:A\to \mathsf{Type}$, the dependent function type recovers $A\to B$

Existential quantification and dependent sums

For any predicate $p: X \to \{\bot, \top\}$, the existential quantification $\exists x \in X, p(x)$ is the logical formula defined by the rules:

- \exists intro: If $a \in X$ and p(a) is true, then $\exists x \in X, p(x)$ is true.
- \exists elim: If $\exists x \in X, p(x)$ is true and q can be derived from the assumption that p(a) is true for some $a \in X$, then q is true.

For any family of types $B: A \to \mathsf{Type}$, the dependent sum type $\sum_{x:A} B(x)$ is governed by the rules:

- $^{\Sigma}$ intro: if there are terms a:A and b:B(a), there is a term $(a,b):\sum_{x:A}B(x)$
- $^{\Sigma}$ elim: given a term $p:\sum_{x:A}B(x)$ there are terms $\pi_1p:A$ and $\pi_2p:B(\pi_1p)$ plus computation rules that relate pairings and projections.

For a constant type family $B: A \to \mathsf{Type}$, the dependent sum type recovers $A \times B$.

Peano's axioms, revisited

The natural numbers

Dedekind's Categoricity Theorem. The natural numbers $\mathbb N$ are characterized by Peano's postulates:

- There is a natural number $0 \in \mathbb{N}$.
- Every natural number $n \in \mathbb{N}$ has a successor $sucn \in \mathbb{N}$.
- 0 is not the successor of any natural number.
- No two natural numbers have the same successor.
- The principle of mathematical induction: for all predicates $p: \mathbb{N} \to \{\bot, \top\}$

$$P(0) \Rightarrow (\forall k \in \mathbb{N}, P(k) \Rightarrow P(\operatorname{suc} k)) \Rightarrow (\forall n \in \mathbb{N}, P(n))$$

Theorem. For any $n \in \mathbb{N}$, $n^2 + n$ is even.

Proof: By induction on $n \in \mathbb{N}$:

Theorem. For any $n \in \mathbb{N}$, $n^2 + n$ is even.

Proof: By induction on $n \in \mathbb{N}$:

• In the base case, when n = 0, $0^2 + 0 = 2 \times 0$, which is even.

Theorem. For any $n \in \mathbb{N}$, $n^2 + n$ is even.

Proof: By induction on $n \in \mathbb{N}$:

- In the base case, when n = 0, $0^2 + 0 = 2 \times 0$, which is even.
- For the inductive step, assume for $k \in \mathbb{N}$ that $k^2 + k = 2 \times m$ is even. Then

$$(k+1)^{2} + (k+1) = (k^{2} + k) + ((2 \times k) + 2)$$

$$= (2 \times m) + (2 \times (k+1))$$

$$= 2 \times (m+k+1)$$
 is even.

•

Theorem. For any $n \in \mathbb{N}$, $n^2 + n$ is even.

Proof: By induction on $n \in \mathbb{N}$:

- In the base case, when n = 0, $0^2 + 0 = 2 \times 0$, which is even.
- For the inductive step, assume for $k \in \mathbb{N}$ that $k^2 + k = 2 \times m$ is even. Then

$$(k+1)^{2} + (k+1) = (k^{2} + k) + ((2 \times k) + 2)$$

$$= (2 \times m) + (2 \times (k+1))$$

$$= 2 \times (m+k+1)$$
 is even.

By the principle of mathematical induction

$$\forall P, P(0) \Rightarrow (\forall k \in \mathbb{N}, P(k) \Rightarrow P(\operatorname{suc} k)) \Rightarrow (\forall n \in \mathbb{N}, P(n))$$

this proves that $n^2 + n$ is even for all $n \in \mathbb{N}$.

The inductive proof not only demonstrates for all $n \in \mathbb{N}$ that $n^2 + n$ is even but also defines a function $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

The inductive proof not only demonstrates for all $n \in \mathbb{N}$ that $n^2 + n$ is even but also defines a function $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. There is a function $m: \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$ for all $n \in \mathbb{N}$.

Construction: By induction on $n \in \mathbb{N}$:

The inductive proof not only demonstrates for all $n \in \mathbb{N}$ that $n^2 + n$ is even but also defines a function $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. There is a function $m: \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$ for all $n \in \mathbb{N}$.

Construction: By induction on $n \in \mathbb{N}$:

• In the base case, $0^2 + 0 = 2 \times 0$, so we define m(0) := 0.

The inductive proof not only demonstrates for all $n \in \mathbb{N}$ that $n^2 + n$ is even but also defines a function $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. There is a function $m: \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$ for all $n \in \mathbb{N}$.

Construction: By induction on $n \in \mathbb{N}$:

- In the base case, $0^2 + 0 = 2 \times 0$, so we define m(0) := 0.
- For the inductive step, assume for $k \in \mathbb{N}$ that $k^2 + k = 2 \times m(k)$. Then

$$(k+1)^2 + (k+1) = (k^2 + k) + ((2 \times k) + 2)$$
$$= (2 \times m(k)) + (2 \times (k+1))$$
$$= 2 \times (m(k) + k + 1)$$

so we define m(k+1) := m(k) + k + 1.

The inductive proof not only demonstrates for all $n \in \mathbb{N}$ that $n^2 + n$ is even but also defines a function $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. There is a function $m: \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$ for all $n \in \mathbb{N}$.

Construction: By induction on $n \in \mathbb{N}$:

- In the base case, $0^2 + 0 = 2 \times 0$, so we define m(0) := 0.
- For the inductive step, assume for $k \in \mathbb{N}$ that $k^2 + k = 2 \times m(k)$. Then

$$(k+1)^{2} + (k+1) = (k^{2} + k) + ((2 \times k) + 2)$$
$$= (2 \times m(k)) + (2 \times (k+1))$$
$$= 2 \times (m(k) + k + 1)$$

so we define m(k+1) := m(k) + k + 1.

By the principle of mathematical recursion, this defines a function $m: \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$ for all $n \in \mathbb{N}$.

Induction and recursion

Recursion can be thought of as the constructive form of induction

$$\forall P, P(0) \Rightarrow (\forall k \in \mathbb{N}, P(k) \Rightarrow P(\mathsf{suc}k)) \Rightarrow (\forall n \in \mathbb{N}, P(n))$$

in which the predicate

$$P \colon \mathbb{N} \to \{\top, \bot\}$$
 such as $P(n) := \exists m \in \mathbb{N}, n^2 + n = 2 \times m$

is replaced by an arbitrary family of sets

$$P \colon \mathbb{N} \to \mathsf{Set}$$
 such as $P(n) \coloneqq \{ m \in \mathbb{N} \mid n^2 + n = 2 \times m \}.$

Induction and recursion

Recursion can be thought of as the constructive form of induction

$$\forall P, P(0) \Rightarrow (\forall k \in \mathbb{N}, P(k) \Rightarrow P(\mathsf{suc}k)) \Rightarrow (\forall n \in \mathbb{N}, P(n))$$

in which the predicate

$$P \colon \mathbb{N} \to \{\top, \bot\}$$
 such as $P(n) \coloneqq \exists m \in \mathbb{N}, n^2 + n = 2 \times m$

is replaced by an arbitrary family of sets

$$P \colon \mathbb{N} \to \mathsf{Set}$$
 such as $P(n) \coloneqq \{ m \in \mathbb{N} \mid n^2 + n = 2 \times m \}.$

The output of a recursive construction is a dependent function $p \in \prod_{n \in \mathbb{N}} P(n)$ which specifies a value $p(n) \in P(n)$ for each $n \in \mathbb{N}$.

$$\forall P, (p_0 \in P(0)) \to (p_s \in \prod_{k \in \mathbb{N}} P(k) \to P(\operatorname{suc} k)) \to (p \in \prod_{n \in \mathbb{N}} P(n))$$

Induction and recursion

Recursion can be thought of as the constructive form of induction

$$\forall P, P(0) \Rightarrow (\forall k \in \mathbb{N}, P(k) \Rightarrow P(\mathsf{suc}k)) \Rightarrow (\forall n \in \mathbb{N}, P(n))$$

in which the predicate

$$P \colon \mathbb{N} \to \{\top, \bot\}$$
 such as $P(n) := \exists m \in \mathbb{N}, n^2 + n = 2 \times m$

is replaced by an arbitrary family of sets

$$P: \mathbb{N} \to \mathsf{Set}$$
 such as $P(n) := \{ m \in \mathbb{N} \mid n^2 + n = 2 \times m \}.$

The output of a recursive construction is a dependent function $p \in \prod_{n \in \mathbb{N}} P(n)$ which specifies a value $p(n) \in P(n)$ for each $n \in \mathbb{N}$.

$$\forall P, (p_0 \in P(0)) \to (p_s \in \prod_{k \in \mathbb{N}} P(k) \to P(\operatorname{suc} k)) \to (p \in \prod_{n \in \mathbb{N}} P(n))$$

The recursive function $p \in \prod_{n \in \mathbb{N}} P(n)$ satisfies computation rules:

$$p(0) := p_0$$
 $p(\operatorname{suc} n) := p_s(n, p(n)).$

The natural numbers in dependent type theory

The natural numbers type $\mathbb N$ is governed by the rules:

• \mathbb{N} intro: there is a term $0 : \mathbb{N}$ and for any term $n : \mathbb{N}$ there is a term $\mathbf{suc} n : \mathbb{N}$

The elimination rule strengthens the principle of mathematical induction by replacing the predicate $P: \mathbb{N} \to \{\bot, \top\}$ by an arbitrary family of types $P: \mathbb{N} \to \mathsf{Type}$.

• Nelim: for any type family $P: \mathbb{N} \to \mathsf{Type}$, to prove $p: \prod_{n:\mathbb{N}} P(n)$ it suffices to prove $p_0: P(0)$ and $p_s: \prod_{k:\mathbb{N}} P(k) \to P(\mathsf{suc}k)$. That is

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Computation rules establish that p is defined recursively from p_0 and p_s .

The natural numbers in dependent type theory

The natural numbers type \mathbb{N} is governed by the rules:

• \mathbb{N} intro: there is a term $0 : \mathbb{N}$ and for any term $n : \mathbb{N}$ there is a term $\mathbf{suc} n : \mathbb{N}$

The elimination rule strengthens the principle of mathematical induction by replacing the predicate $P: \mathbb{N} \to \{\bot, \top\}$ by an arbitrary family of types $P: \mathbb{N} \to \mathsf{Type}$.

• Nelim: for any type family $P: \mathbb{N} \to \mathsf{Type}$, to prove $p: \prod_{n:\mathbb{N}} P(n)$ it suffices to prove $p_0: P(0)$ and $p_s: \prod_{k:\mathbb{N}} P(k) \to P(\mathsf{suc}k)$. That is

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Computation rules establish that p is defined recursively from p_0 and p_s .

Note the other two Peano postulates are missing because they are provable!

Identity types

The following rules for identity types were developed by Martin-Löf:

Given a type A and terms x, y : A, the identity type $x =_A y$ is governed by the rules:

• =intro: given a type A and term x : A there is a term $refl_x : x =_A x$

The elimination rule for the identity type defines an induction principle analogous to recursion over the natural numbers: it provides sufficient conditions for which to define a dependent function out of the identity type family.

• =elim: for any type family P(x, y, p) over x, y : A and $p : x =_A y$, to prove P(x, y, p) for all x, y, p it suffices to assume y is x and p is refl_x. That is

$$=_{\mathsf{ind}}: \left(\prod_{x:A} P(x, x, \mathsf{refl}_x)\right) \to \left(\prod_{x, y:A} \prod_{p: x = Ay} P(x, y, p)\right)$$

A computation rule establishes that the proof of $P(x, x, refl_x)$ is the given one.

U

=elim: For any type family P(x, y, p) over x, y : A and $p : x =_A y$,

$$\overset{=}{\operatorname{ind}}: \left(\prod\nolimits_{x:A} P(x,x,\operatorname{refl}_x)\right) \to \left(\prod\nolimits_{x,y:A} \prod\nolimits_{p:x=_{A}y} P(x,y,p)\right)$$

Theorem (symmetry). $(-)^{-1}: \prod_{x,y:A} x =_A y \rightarrow y =_A x$.

=elim: For any type family P(x, y, p) over x, y : A and $p : x =_A y$,

$$\overset{=}{\operatorname{ind}}: \left(\prod\nolimits_{x:A} P(x,x,\operatorname{refl}_x)\right) \to \left(\prod\nolimits_{x,y:A} \prod\nolimits_{p:x=_{A}y} P(x,y,p)\right)$$

Theorem (symmetry).
$$(-)^{-1}:\prod_{x,y:A}x=_Ay\to y=_Ax$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $P(x, y, p) := y =_A x$.

=elim: For any type family P(x, y, p) over x, y : A and $p : x =_A y$,

$$=_{\mathsf{ind}}: \left(\prod\nolimits_{x:A} P(x,x,\mathsf{refl}_x)\right) \to \left(\prod\nolimits_{x,y:A} \prod\nolimits_{p:x=_{A}y} P(x,y,p)\right)$$

Theorem (symmetry).
$$(-)^{-1}:\prod_{x,y:A}x=_Ay\to y=_Ax$$
.

Construction: By ^{II}intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $P(x, y, p) := y =_A x$. By ⁼elim, we may reduce to the case $P(x, x, \text{refl}_x) := x =_A x$, for which we have $\text{refl}_x : x =_A x$.

=elim: For any type family
$$P(x, y, p)$$
 over $x, y : A$ and $p : x =_A y$,

$$\stackrel{=}{\operatorname{ind}}: \left(\prod\nolimits_{x:A} P(x,x,\operatorname{refl}_x)\right) \to \left(\prod\nolimits_{x,y:A} \prod\nolimits_{p:x=_{A}y} P(x,y,p)\right)$$

Theorem (symmetry).
$$(-)^{-1}:\prod_{x,y:A}x=_Ay\to y=_Ax$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $P(x, y, p) := y =_A x$. By $^{=}$ elim, we may reduce to the case $P(x, x, \text{refl}_x) := x =_A x$, for which we have $\text{refl}_x : x =_A x$.

Theorem (transitivity).
$$*: \prod_{x,y,z:A} x =_A y \to (y =_A z \to x =_A z)$$
.

=elim: For any type family
$$P(x, y, p)$$
 over $x, y : A$ and $p : x =_A y$,
$$= \inf : \left(\prod_{x:A} P(x, x, \text{refl}_x) \right) \to \left(\prod_{x,y:A} \prod_{p:x=_A y} P(x, y, p) \right)$$

Theorem (symmetry).
$$(-)^{-1}:\prod_{x,y:A}x=_Ay\to y=_Ax$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $P(x, y, p) := y =_A x$. By $^{=}$ elim, we may reduce to the case $P(x, x, \text{refl}_x) := x =_A x$, for which we have $\text{refl}_x : x =_A x$.

Theorem (transitivity).
$$*: \prod_{x,y,z:A} x =_A y \to (y =_A z \to x =_A z)$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $Q(x, y, p) := \prod_{z:A} y =_A z \to x =_A z$.

=elim: For any type family
$$P(x, y, p)$$
 over $x, y : A$ and $p : x =_A y$,
=ind : $\left(\prod_{x \in A} P(x, x, \text{refl}_x)\right) \to \left(\prod_{x \in A} \prod_{p:x =_A y} P(x, y, p)\right)$

Theorem (symmetry).
$$(-)^{-1}: \prod_{x,y:A} x =_A y \rightarrow y =_A x$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x, y : A and $p : x =_A y$ and then define a term of type $P(x, y, p) := y =_A x$. By $^{=}$ elim, we may reduce to the case $P(x, x, \text{refl}_x) := x =_A x$, for which we have $\text{refl}_x : x =_A x$.

Theorem (transitivity).
$$*: \prod_{x,y,z:A} x =_A y \to (y =_A z \to x =_A z)$$
.

Construction: By $^{\Pi}$ intro it suffices to assume x,y:A and $p:x=_Ay$ and then define a term of type $Q(x,y,p):=\prod_{z:A}y=_Az\to x=_Az$. By $^=$ elim, we may reduce to the case $Q(x,x,\text{refl}_x):=\prod_{z:A}x=_Az\to x=_Az$, for which we have id $:=\lambda q.q:x=_Az\to x=_Az$.

Functions preserve identifications

=elim: For any type family
$$P(x, y, p)$$
 over $x, y : A$ and $p : x =_A y$,
$$= \inf : \left(\prod_{x : A} P(x, x, \text{refl}_x) \right) \to \left(\prod_{x, y : A} \prod_{p : x =_A y} P(x, y, p) \right)$$

In set theory, a function $f: X \to Y$ is well-defined: if x = x' then f(x) = f(x').

Functions preserve identifications

=elim: For any type family
$$P(x, y, p)$$
 over $x, y : A$ and $p : x =_A y$,
$$= \inf : \left(\prod_{x : A} P(x, x, \text{refl}_x) \right) \to \left(\prod_{x, y : A} \prod_{p : x =_A y} P(x, y, p) \right)$$

In set theory, a function $f: X \to Y$ is well-defined: if x = x' then f(x) = f(x').

Theorem. For any $f: A \to B$, a, a': A, and $p: a =_A a'$, there is a term

$$\mathsf{ap}_f p : f(a) =_B f(a').$$

Construction: Let $f: A \to B$. By =elim applied to the family $P(x, y, p) := f(x) =_B f(y)$, to define $\underset{ap_f}{\mathsf{ap}_f} : \prod_{a,a':A} (a =_A a') \to (f(a) =_B f(a'))$ we may reduce to the case $\prod_{a:A} f(a) =_B f(a)$, for which we have $\lambda a.\mathsf{refl}_{f(a)} : \prod_{a:A} f(a) =_B f(a)$.

Nelim: For any type family P(n) over $n : \mathbb{N}$,

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Using the elimination rule for the natural numbers type, (dependent) functions out of $\mathbb N$ may be defined inductively by specifying their values on 0 and $\mathrm{suc} k$ for any $k : \mathbb N$.

Nelim: For any type family P(n) over $n : \mathbb{N}$,

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Using the elimination rule for the natural numbers type, (dependent) functions out of \mathbb{N} may be defined inductively by specifying their values on 0 and suck for any $k : \mathbb{N}$.

$$\bullet \ 2\times : \mathbb{N} \to \mathbb{N} \text{ is defined by } \begin{cases} 2\times 0 \coloneqq 0 \\ 2\times \mathsf{suc} k \coloneqq \mathsf{suc}(\mathsf{suc}(2\times k)) \end{cases}$$

Nelim: For any type family P(n) over $n : \mathbb{N}$,

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Using the elimination rule for the natural numbers type, (dependent) functions out of \mathbb{N} may be defined inductively by specifying their values on 0 and suck for any $k : \mathbb{N}$.

$$\bullet \ \ 2\times : \mathbb{N} \to \mathbb{N} \ \text{is defined by} \ \begin{cases} 2\times 0 \coloneqq 0 \\ 2\times \mathsf{suc} \mathit{k} \coloneqq \mathsf{suc}(\mathsf{suc}(2\times \mathit{k})) \end{cases}$$

•
$$+: \mathbb{N} \to \mathbb{N} \to \mathbb{N}$$
 is defined by
$$\begin{cases} m+0 := m \\ m+\operatorname{suc} k := \operatorname{suc}(m+k) \end{cases}$$

Nelim: For any type family P(n) over $n : \mathbb{N}$,

$$^{\mathbb{N}}\mathsf{ind}:P(0)\to \left(\prod\nolimits_{k\in\mathbb{N}}P(k)\to P(\mathsf{suc}k)\right)\to \left(\prod\nolimits_{n\in\mathbb{N}}P(n)\right)$$

Using the elimination rule for the natural numbers type, (dependent) functions out of \mathbb{N} may be defined inductively by specifying their values on 0 and suck for any $k : \mathbb{N}$.

- $\bullet \ \ 2 \times : \mathbb{N} \to \mathbb{N} \ \text{is defined by} \ \begin{cases} 2 \times 0 \coloneqq 0 \\ 2 \times \mathsf{suc} \mathit{k} \coloneqq \mathsf{suc}(\mathsf{suc}(2 \times \mathit{k})) \end{cases}$
- $+: \mathbb{N} \to \mathbb{N} \to \mathbb{N}$ is defined by $\begin{cases} m+0 \coloneqq m \\ m+\operatorname{suc}k \coloneqq \operatorname{suc}(m+k) \end{cases}$
- $\mathsf{dist}_{2\times}:\prod_{m:\mathbb{N}}\prod_{n:\mathbb{N}}2\times m+2\times n=_{\mathbb{N}}2\times (m+n)$ is defined by

$$\begin{cases} \mathsf{dist}_{2\times}(m,0) \coloneqq \mathsf{refl}_{2\times m} \\ \mathsf{dist}_{2\times}(m,\mathsf{suc}k) \coloneqq \mathsf{ap}_{\mathsf{suc} \circ \mathsf{suc}}(\mathsf{dist}_{2\times}(m,n)) \end{cases}$$

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square} + \mathsf{self}(0) \coloneqq 0 \\ \mathsf{square} + \mathsf{self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n \in \mathbb{N}} \sum_{m \in \mathbb{N}} \mathsf{square} + \mathsf{self}(n) =_{\mathbb{N}} 2 \times m.$$

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square+self}(0) \coloneqq 0 \\ \mathsf{square+self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square+self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n:\mathbb{N}} \sum_{m:\mathbb{N}} \mathsf{square+self}(n) =_{\mathbb{N}} 2 \times m.$$

Construction: By \mathbb{N} elim, it suffices to prove two cases:

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square} + \mathsf{self}(0) \coloneqq 0 \\ \mathsf{square} + \mathsf{self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n \in \mathbb{N}} \sum_{m \in \mathbb{N}} \mathsf{square} + \mathsf{self}(n) =_{\mathbb{N}} 2 \times m.$$

Construction: By ^Nelim, it suffices to prove two cases:

• For $0: \mathbb{N}$, we have $(0, \text{refl}_0): \sum_{m:\mathbb{N}} \text{square} + \text{self}(0) =_{\mathbb{N}} 2 \times m$.

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square} + \mathsf{self}(0) \coloneqq 0 \\ \mathsf{square} + \mathsf{self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n \in \mathbb{N}} \sum_{m \in \mathbb{N}} \mathsf{square} + \mathsf{self}(n) =_{\mathbb{N}} 2 \times m.$$

Construction: By Nelim, it suffices to prove two cases:

- For $0: \mathbb{N}$, we have $(0, \mathsf{refl}_0): \sum_{m:\mathbb{N}} \mathsf{square} + \mathsf{self}(0) =_{\mathbb{N}} 2 \times m$.
- For suck: \mathbb{N} , from m(k): \mathbb{N} and p(k): square+self(k) = \mathbb{N} 2 × m(k)

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square} + \mathsf{self}(0) \coloneqq 0 \\ \mathsf{square} + \mathsf{self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n \in \mathbb{N}} \sum_{m \in \mathbb{N}} \mathsf{square} + \mathsf{self}(n) =_{\mathbb{N}} 2 \times m.$$

Construction: By Nelim, it suffices to prove two cases:

- For $0: \mathbb{N}$, we have $(0, \text{refl}_0): \sum_{m:\mathbb{N}} \text{square} + \text{self}(0) =_{\mathbb{N}} 2 \times m$.
- For suck : \mathbb{N} , from m(k) : \mathbb{N} and p(k) : square+self(k) = \mathbb{N} 2 × m(k) we have:

$$\begin{split} \operatorname{ap}_{+2\times\operatorname{suc}k}p(k):\operatorname{square}+\operatorname{self}(k)+2\times\operatorname{suc}k=_{\mathbb{N}}2\times\mathit{m}(k)+2\times\operatorname{suc}k\\ \operatorname{dist}_{2\times}(\mathit{m}(k),2\times\operatorname{suc}k):2\times\mathit{m}(k)+2\times\operatorname{suc}k=_{\mathbb{N}}2\times(\mathit{m}(k)+\operatorname{suc}k) \end{split}$$

We proved for any $n \in \mathbb{N}$, that $n^2 + n$ is even by induction and by recursively defining $m : \mathbb{N} \to \mathbb{N}$ so that $n^2 + n = 2 \times m(n)$.

Theorem. For square+self:
$$\mathbb{N} \to \mathbb{N}$$
 given by
$$\begin{cases} \mathsf{square} + \mathsf{self}(0) \coloneqq 0 \\ \mathsf{square} + \mathsf{self}(\mathsf{suc}k) \coloneqq \\ \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc}k \end{cases}$$
$$\prod_{n \in \mathbb{N}} \sum_{m \in \mathbb{N}} \mathsf{square} + \mathsf{self}(n) =_{\mathbb{N}} 2 \times m.$$

Construction: By Nelim, it suffices to prove two cases:

- For $0: \mathbb{N}$, we have $(0, \text{refl}_0): \sum_{m:\mathbb{N}} \text{square} + \text{self}(0) =_{\mathbb{N}} 2 \times m$.
- For suck: \mathbb{N} , from m(k): \mathbb{N} and p(k): square+self(k) = \mathbb{N} 2 × m(k) we have:

$$\begin{aligned} \mathsf{ap}_{+2 \times \mathsf{suc} k} p(k) : \mathsf{square} + \mathsf{self}(k) + 2 \times \mathsf{suc} k =_{\mathbb{N}} 2 \times \textit{m}(k) + 2 \times \mathsf{suc} k \\ \mathsf{dist}_{2 \times} (\textit{m}(k), 2 \times \mathsf{suc} k) : 2 \times \textit{m}(k) + 2 \times \mathsf{suc} k =_{\mathbb{N}} 2 \times (\textit{m}(k) + \mathsf{suc} k) \end{aligned}$$

Composing these identifications yields the desired term:

$$(\textit{m}(\textit{k}) + \mathsf{suc}\textit{k}, \mathsf{ap}_{+2 \times \mathsf{suc}\textit{k}} \textit{p}(\textit{k}) \cdot \mathsf{dist}_{2 \times}(\textit{m}(\textit{k}), 2 \times \mathsf{suc}\textit{k})) : \sum\nolimits_{\textit{m} \cdot \mathbb{N}} \mathsf{square} + \mathsf{self}(\mathsf{suc}\textit{k}) =_{\mathbb{N}} 2 \times \textit{m} \ \Box$$
